

Orders API Authentication Guide

Authentication Mechanism

The Orders API uses OAuth 2.0 access tokens issued by the Identity Service. Clients send the token in the HTTP Authorization header using the Bearer scheme.

Required Scopes

GET /orders requires `orders:read`. POST /orders requires `orders:write`.

Token Lifetime

Access tokens are valid for 15 minutes. Refresh tokens are handled by the Identity Service and are not accepted by the Orders API.

Errors

Missing token returns 401. Valid token without the required scope returns 403.
